

**Mission:**

Population aging is one of the biggest threats of the twenty-first century that comes with far-reaching consequences. The number of people over the age of 65 years is projected to be [2.1 billion in 2050](#). Conversely, the number of caregivers is rapidly decreasing. Over-reliance on human observation in the care of seniors means that we don't have enough resources to scale elder care worldwide. As the world ages, we will need a technology force multiplier to augment human observation to provide just-in-time and sustainable senior care.

Our mission at CarePredict is to minimize reliance on human observation in the care of seniors and provide constant visibility into their health using machine sensing and learning. Our products and solutions are designed specifically to help our older loved ones age independently, economically, and live longer.
